

Colorcon No-Tox® Pharmaceutical Printing Inks

Meeting the Needs of Your Pharmaceutical Packaging Applications

Serving the world's non-toxic printing ink needs for 50 years, Colorcon's No-Tox® Products Division is a leading manufacturer of U.S. Food & Drug Administration (FDA) and EU compliant printing inks.

Colorcon's expertise in printing ink technology is based on a solid foundation built over five decades of manufacturing printing inks for the food, medical device and pharma industries.

Our highly specialized No-Tox pharmaceutical inks are used for solid oral dose (SOD) blister packs, tablet bottle seals, desiccants, tablet product identifications, transdermal patches and many other applications that directly or indirectly come in contact with the drug.

Our printing inks are manufactured exclusively from FDA compliant components in a dedicated current Good Manufacturing Practices (cGMP) facility.

A key component in the selection of printing inks for pharmaceutical applications is the potential for contamination of the tablet or other solid oral dosage form through direct or indirect contact with the ink.

All No-Tox printing inks are manufactured exclusively from FDA and/or EU compliant components in an ISO 9001:2015 certified, dedicated current Good Manufacturing Practices (cGMP) facility, using cGMP practices.

We provide our customers with the safest line of regulatory compliant printing inks for printing applications that involve direct and indirect contact with pharma, food or medical products and back this up with a written compliance guarantee.

Our products comply with all pertinent FDA and EU regulations as well as CONEG heavy metal restrictions.

Colorcon offers three distinct ink and coating product lines NO-TOX[®], FLEXICRAFT[®] and LITHOSAFE[®]

NO-TOX[®] inks and coatings are appropriate for all commonly used printing methods where direct contact with pharmaceutical, food or medical products is anticipated.

FLEXICRAFT[®] water-based flexographic and gravure inks and coatings and **LITHOSAFE[®]** inks and overprint varnishes are ideal for minimal or indirect contact applications or where a functional barrier is employed. They are used in pharmaceutical and medical packaging applications where minimal or indirect product contact is intended.

No-Tox inks are specified by many of the world's leading food, medical device and pharmaceutical companies.

We create standard, process and custom colors, as well as aqueous coatings and varnishes.

Every product we create is designed with three paramount goals in mind: the ink must be safe for the intended use, work on conventional printing equipment and must be user friendly. To this extent our scientists consider substrates, migration potential and printing methods in every ink they create.

Few of the raw materials used in conventional inks can be used in No-Tox inks. Colorcon is often working with an entirely different – and more expensive – set of raw materials that has undergone rigorous testing and subsequent approval by the respective regulatory bodies.

The raw materials used in No-Tox inks are classified as indirect and direct food additives by the FDA and EU regulatory bodies. Since the products we create must meet the high standards of a variety of federal regulations, our raw materials are individually sampled and tested to ensure highest purity levels.

Because of our individual raw material testing, documented manufacturing processes and operating principles we are the only company that provides its customers with a written compliance guarantee for its inks. As a result No-Tox inks are specified by many of the world's leading food, medical device and pharmaceutical companies.
